## $\theta$ CollogeBoard AP

## AP CSP

BIG IDEA for the week:
3- ALGORITHMS AND PROGRAMMING

At this time, I have unlocked most of Unit 5 for you and you may work ahead of schedule if you like. LET

ME KNOW if you need me to unlock an assessment for you or if I can help you with any of the programs.

| Day | occmenyency musstlye on scrouluy ELIGIBLE for a free laptop to KEEP!! |
| :---: | :---: |
| Mon $4.20$ | How's it going? https://www.surveymonkey.com/r/YNHVDCW <br> Your ONLY assignment today is the above, short survey. <br> *optional: (Below is a video of on online discussion about COVID19. I went to it this weekend and it is led by a science researcher.)Science Circle Discussion |
| Tues 4.21 | CREATE TASK walkthrough: <br> https://www.youtube.com/watch?v=rNINFYJ9Spc <br> -Check in each day to let me know how it's going <br> -Continue with UNIT 5! |
| Wed <br> 4.22 | -Begin CREATE task (= <br> -our last CODE.org test for Unit5 (on pseudo code) is scheduled for April 27th. |
| Thurs | Code break Wednesday code.org/break |

| 4.23 | for one hour on Wed. |

https://www.edx.org/course/using-python-for-research
Syntax

```
1 \text { for (initialization; condition; increment) \{}
    // block of statements
3}
```

Here is a typical construct for loop used to count from 0 to 3 to execute the block of code 4 times:
for(var $i=0 ; i<4 ; i++)$
initialization var $i=0$; is executed once, before anything else. Create an identifier named $i$ and initialize it to 0 .
condition $i<4$; is checked before each iteration, to see if the block of statements should execute or not. If $i$ is less than 4 .
increment i++ is executed after every iteration, after the block of statements is executed. Increase (increment) $i$ by 1.

## AP CSP pseudocode

## Assignment, display, and input

$\mathrm{a} \leftarrow$ expression

- Evaluates expression and assigns the result to the variable a.
- $\quad \square$ Practice: Storing data in variables

DISPLAY (expression)

- Displays the value of expression, followed by a space.
- $\quad \square$ Practice: Programming basics

INPUT ()

- Accepts a value from the user and returns it.

## Arithmetic operators and numeric procedures

$a+b a-b a * b a / b$

- The arithmetic operators,,,$+-{ }^{*}$, and $/$, are used to perform arithmetic on a and b.
- $\quad \square$ Practice: Mathematical expressions
a MOD b
- Evaluates to the remainder when $a$ is divided by $b$. Assumes that $a$ and $b$ are positive integers.
- $\square$ Practice: Mathematical expressions

RANDOM ( $\mathrm{a}, \mathrm{b}$ )

- Evaluates to a random integer from a to b , including a and b .
- $\quad \square$ Practice: Random numbers

## Relational and Boolean operators

$\mathrm{a}=\mathrm{b} \mathrm{a} \neq \mathrm{b} \mathrm{a}>\mathrm{b} \mathrm{a}<\mathrm{b} \mathrm{a} \geq \mathrm{b} \mathrm{a} \leq \mathrm{b}$

- The relational operators, $=, \neq,>,<, \geq$, and $\leq$ are used to test the relationship between two expressions, variables, or values.
- $\quad \square$ Practice: Conditionals with if, else, and Booleans

NOT condition

- Evaluates to true if condition is false; otherwise evaluates to false.
- $\quad \square$ Practice: Compound Booleans with logical operators
condition1 AND condition2
- Evaluates to true if both condition1 and condition2 are true; otherwise evaluates to false.
- $\quad \square$ Practice: Compound Booleans with logical operators
condition1 OR condition2
- Evaluates to true if condition1 is true or if condition2 is true or if both condition1 and condition2 are true; otherwise evaluates to false.
- $\quad \square$ Practice: Compound Booleans with logical operators

## Selection

```
IF (<condition>) { <block of statements> }
```

- The code in block of statements is executed if the Boolean expression condition evaluates to true; no action is taken if condition evaluates to false.
- $\quad \square$ Practice: Conditionals with if, else, and Booleans

```
IF (<condition>) { <first block of statements> } ELSE { <second block of
statements> }
```

- The code in first block of statements is executed if the Boolean expression condition evaluates to true; otherwise the code in second block of statements is executed.
- $\quad \square$ Practice: Conditionals with if, else, and Booleans, Nested conditionals

## Iteration

REPEAT $n$ TIMES \{ <block of statements> \}

- The code in block of statements is executed $n$ times.
- $\quad \square$ Practice: Numbered repetition of instructions

REPEAT UNTIL (condition) \{ <block of statements> \}

- The code in block of statements is repeated until the Boolean expression condition evaluates to true.
- $\quad \square$ Practice: Conditional repetition of instructions

## List operations

For all list operations, if a list index is less than 1 or greater than the length of the list, an error message is produced and the program terminates.
list[i]

- Refers to the element of list at index i. The first element of list is at index 1.
- $\quad \square$ Practice: Storing and updating lists
list[i] $\leftarrow$ list[j]
- Assigns the value of list[j] to list[i].
- $\quad \square$ Practice: Storing and updating lists
list $\leftarrow$ [value1, value2, value3]
- Assigns value1, value2, and value3 to list [1], list[2], list[3], respectively.
- $\quad \square$ Practice: Storing and updating lists

FOR EACH item IN list \{ <block of statements> \}

- The variable item is assigned the value of each element of list sequentially, in order from the first element to the last element. The code in block of statements is executed once for each assignment of item.
- $\quad \square$ Practice: Iterating over lists with loops

```
INSERT (list, i, value)
```

- Any values in list at indices greater than or equal to $i$ are shifted to the right. The length of list is increased by 1 , and value is placed at index i in list.
- $\quad \square$ Practice: Storing and updating lists

APPEND (list, value)

- The length of list is increased by 1 , and value is placed at the end of list.
- $\quad \square$ Practice: Storing and updating lists

```
REMOVE (list, i)
```

- Removes the item at index $i$ in list and shifts to the left any values at indices greater than i. The length of list is decreased by 1 .
- $\quad \square$ Practice: Storing and updating lists

LENGTH (list)

- Evaluates to the number of elements in list.

## Procedures

```
PROCEDURE name (parameter1, parameter2, ...) { <instructions> }
```

- A procedure, name, takes zero or more parameters. The procedure contains programming instructions.
- $\quad \square$ Practice: Defining a procedure, Procedures with parameters

PROCEDURE name (parameter1, parameter2, ...) \{ <instructions> RETURN (expression) \}

- A procedure, name, takes zero or more parameters. The procedure contains programming instructions and returns the value of expression. The RETURN statement may appear at any point inside the procedure and causes an immediate return from the procedure back to the calling program.
- $\quad \square$ Practice: Procedures with return values

## Robot

If the robot attempts to move to a square that is not open or is beyond the edge of the grid, the robot will stay in its current location and the program will terminate.

MOVE_FORWARD ()

- The robot moves one square forward in the direction it is facing.

ROTATE_LEFT ()

- The robot rotates in place 90 degrees counterclockwise (i.e. makes an in-place left turn).

ROTATE_RIGHT ()

- The robot rotates in place 90 degrees clockwise (i.e. makes an in-place right turn).

```
CAN_MOVE (direction)
```

- Evaluates to true if there is an open square one square in the direction relative to where the robot is facing; otherwise evaluates to false. The value of direction can be left, right, forward, or backward.
$\square$ Practice of robot-like questions are throughout the Repetition lesson.

There are many differences between the AP CSP pseudocode and the JavaScript language syntax.
This table highlights the biggest differences:

| Concept | Pseudocode | JavaScript |
| :--- | :--- | :--- |
| Assignment | $a \leftarrow$ expression | var $a=$ expression; |
| Equality | $a=b$ | $a==b$ |
| Inequality | $a \neq b$ | $a!=b$ |
| Repetition | REPEAT $n$ TIMES | for (var $i=0 ; i<n ; i++$ ) |
| Repetition | REPEAT UNTIL (condition) | while (condition) |
| List index | list[1] is first item | list[0] is first item |
| List iteration FOR EACH item IN list | for (var $i=0 ; i<l i s t . l e n g t h ; ~ i++) ~$ |  |
